## C-Band Interference Elimination Filters

Series 7894D

Historically, the solution for eliminating **out-of-band** interference (e.g. - RADAR) has been to install a highly-selective bandpass filter. Specifically, a filter with a passband corresponding to that region's standard footprint (i.e. - **3700-4200 MHz**, **3400-4200 MHz**, etc.).

However, not long ago, WiMAX began operating in the (**3400-3800**) MHz frequency band in many regions around the world. This **common band** operation causes **in-band** interference at C-band receive sites that cannot be eliminated with "standard footprint" BPFs.

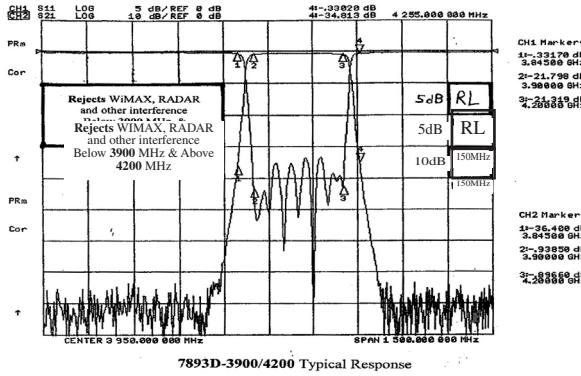

**Example :** WiMAX - operating at **3700** MHz - causes interference at a C-band receive site (where the footprint is **3700-4200** MHz). A standard footprint BPF will pass **all** frequencies from 3700-4200 MHz (i.e. - **including** the interfering WiMAX signal).

**Solution :** Install an MFC model **7893D-3780/4200** bandpass filter that will provide **30 dB rejection** at **3700** MHz and will pass all remaining C-band from (**3780-4200**) MHz.

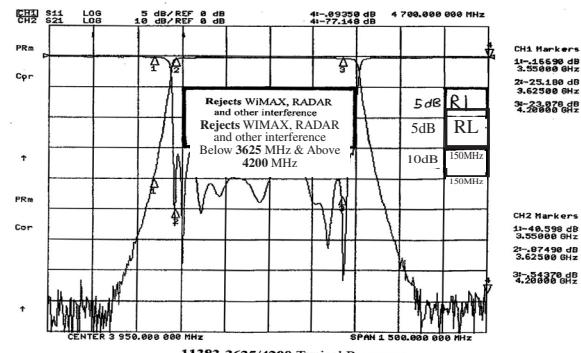

- **Low Insertion Loss – Typically less than 1 dB**
- **Also Rejects Transmit Band (5800-6725 MHz) >70 dB Typ – Eliminating the need for a separate TRF**
- **Low Group Delay Variation - 8 nS Max**
- **Compact Size – For easy installation on single or multi-feed LNBs**
- **Superior VSWR Performance - 1.5:1 Max**
- **Quick Turnaround – Most orders ship within (1-5) days ARO**

Following are just some of our many filtering solutions for eliminating WiMAX, RADAR and other C-band interference :
